

How to find data using BigQuery

So far, you've learned that BigQuery is a powerful tool for managing and analyzing datasets efficiently. In this reading, you'll learn more about how to discover and use different types of data sets within BigQuery, including public, shared, and external datasets. You'll also learn how to use the Explorer panel for efficient data search, and about the significance of tracing data sources.

Discover public data sets through marketplace

To effectively use BigQuery to analyze public datasets, you must first search for and attach the dataset from the BigQuery Marketplace interface.

To access and verify a public dataset, complete these steps:

1. Click on + ADD button in BigQuery explore to add a dataset.
2. Navigate to public datasets to launch the Marketplace interface within BigQuery.
3. Select your dataset.
4. Click on VIEW DATASET to attach the dataset to BigQuery Explorer.
5. Navigate to the desired table within the dataset.
6. Review the schema.
7. Review the details section.

Once you find a dataset, view its details and import it into your project for analysis.

Use Data Transfer for external datasets

You can use BigQuery's Data Transfer service to access external datasets. Data Transfer allows you to integrate data from external sources, like databases or cloud storage, into your BigQuery project.

To get started:

1. Navigate to the Data Transfer section in BigQuery.
2. Set up a data transfer from the desired external source, and follow the steps provided.

Use the BigQuery Explorer panel for shared datasets

The BigQuery Explorer panel is a powerful tool for searching datasets. Just enter relevant keywords in the search bar and the panel will display datasets that match your criteria. For example, typing “X” in the search bar yields several results related to X. The Explorer panel is also efficient for finding shared datasets, including those available within your own project, or shared by other users in your organization.

To use the BigQuery Explorer panel for shared datasets, follow these steps:

1. Open the BigQuery Explorer panel.
2. Navigate to datasets listed under your project.
3. Or, search for specific datasets using keywords related to your analysis.

View dataset details using the Explorer panel

Understanding a dataset's details is crucial for effective data analysis. With the Explorer panel, you can:

1. Select a dataset to view its schema, including tables in the dataset, their structure, type of fields, and other metadata.
2. Review detailed information about the data source, like its origins, last update, and size.
3. Trace a data source, or where the data comes from. This is essential for ensuring its reliability and relevance.

Key takeaways

In this reading, you learned how to navigate BigQuery, discover public, shared, and external datasets, and use the Explorer panel for effective data search. Understanding how to view and interpret dataset details is crucial for any data analysis task. These skills are fundamental for leveraging BigQuery's capabilities to turn data into actionable insights.

Resources for more information

Check out these resources to learn more about how you can query BigQuery datasets to find the data you need:

- [Google Cloud](#) provides an overview of public data sets and how to access them using BigQuery.
- Google Cloud provides an [introduction](#) to using SQL to query data in BigQuery.
